

Where there is a possibility of entrapment within a latched enclosure, safety standards require the use of a latch or handle fitted with an inside release mechanism. Latches without this feature are intended for use only on small units or units with insufficient space for entrapment.

### **WARNING**

This latch cannot be opened from the inside when locked, therefore it should not be used on doors which are the sole means of exit from walk-ins. When safety latches are required, see Kason SafeGuard® latches in this section.

### INSIDE RELEASE MECHANISMS

Kason engineers urge you to test the operation of inside release mechanisms after installation. For an inside release to function properly, all designated parts must be installed correctly.
